

BOTANICAL PAVILION NY

The Botanical Pavilion seeks to leverage the existing vegetation and create the correct conditions for its development all around the building, covering it until it merges with the existing landscape.

Inside the building, there will be a new ecosystem in which the main state's botanical species will be displayed.

Visitors will be able to walk around the garden at ground level and among the treetops

The roof will be used as a rain water collector, the water will be carried by a pipe to an artificial pond inside the building. All the water will be used to balance the new interior ecosystem.
